## Abstracts

According to our (Global Info Research) latest study, the global Automatic Profiling Buoy market size was valued at US\$ 20.96 million in 2025 and is forecast to a readjusted size of US\$ 32.32 million by 2032 with a CAGR of 6.4% during review period.

In 2025, global Automatic Profiling Buoy production reached approximately 746 units, with an average global market price of around US\$27.3k per unit.

An automatic profiling buoy is a marine observation platform that operates without onboard personnel, relying on its own buoyancy adjustment device to periodically move up and down in the seawater to 'profile' the ocean. It typically dives from the sea surface to a target depth according to a set cycle, and then rises back to the vicinity of the surface. It transmits profile data such as temperature, salinity, and pressure (as well as expandable data such as dissolved oxygen, pH, nitrate, and chlorophyll) via satellite communication. It drifts for a long time, providing basic observations for climate change research, ocean circulation monitoring, and operational ocean forecasting.

The upstream mainly consists of high-pressure-resistant shell materials and structural components (titanium alloy/high-strength aluminum/engineering plastics, fiberglass composites, etc.), seals and corrosion-resistant connectors, lithium battery packs, buoyancy regulating pumps/valves, sensors (CTD, etc.), and satellite communication modules (Iridium/Argos); the midstream involves the design, manufacturing, and system integration of the entire system (buoy platform + sensors + energy management + telemetry software and quality control); the downstream mainly comprises national and regional marine observation agencies, research institutes, marine meteorological and

climate research units, and operational departments that provide data for marine forecasting, marine engineering, and environmental monitoring. Representative platform/system participants include Teledyne Webb Research (APEX buoy), NKE Instrumentation (ARVOR/DEEP ARVOR), and the international Argo program's related cooperation network (manufactured by commercial companies and research institutions and deployed and operated according to unified standards).

The annual production capacity of a single-line Automatic Profiling Buoy is approximately 15 units, with a gross profit margin of approximately 25%-45%.
