The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Automatic Regenerative Thermal Oxidizer (RTO) is a type of industrial air pollution control equipment that is used to treat exhaust air emissions from industrial processes. It works by oxidizing the pollutants in the exhaust air stream at high temperatures, typically between 815°C to 980°C (1500°F to 1800°F), converting them into carbon dioxide and water vapor. The RTO is called 'regenerative' because it uses a heat exchanger to recover and reuse the heat generated during the oxidation process, making it a more energy-efficient solution.

The upstream industry chain of Automatic Regenerative Thermal Oxidizer includes the production of raw materials such as steel and other metals, as well as the manufacturing of control systems and heat exchangers. The downstream industry chain includes industries that produce exhaust air emissions, such as the chemical, pharmaceutical, and food processing industries.
