## Abstracts

The global Automatic Scroll Compressor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The automatic scroll compressor is a volumetric compression device in which the working volume makes a rotary motion. The two scrolls of the automatic scroll compressor have their own centers of rotation, and the center distance is equal to the eccentricity that ensures the correct meshing of the two scrolls. Generally, one of the two scrolls is called the driving scroll, which is driven by the drive shaft to rotate in a plane while inputting power, and the other scroll is called the driven scroll or the free scroll. For the automatic scroll compressor, the position and direction of the sealing line on the side are on the two tangents of the circle, with a phase difference of 180°, and the position and direction of the sealing line remain unchanged. The automatic scroll compressor requires the adoption of an appropriate control mechanism to ensure the synchronous movement of the two scrolls.
