The automatic triaxial testing system is a specialized experimental equipment used in the field of geotechnical engineering, primarily consisting of a pressure chamber, axial loading device, data acquisition system, control system, and other components. It is primarily utilized for conducting triaxial compression tests on geomaterials such as soil and rock, to determine their mechanical properties under varying confining pressures (lateral pressures) and axial pressures. These properties include shear strength, elastic modulus, Poisson's ratio, and others. This system can simulate the three-dimensional stress states that geomaterials experience in actual engineering scenarios, providing crucial parametric evidence for the design, construction, and stability analysis of geotechnical projects.
