The ignition coil iron core is a type of iron core specifically designed for automotive ignition systems, with a specific structure and function, used to generate high-voltage electrical energy to ignite automotive engines. And general iron cores are widely used in various electronic circuits, with different shapes and structures, to enhance or control magnetic fields. The ignition coil core is usually a circular or cylindrical core made of highly magnetic materials such as silicon steel sheets. Its design aims to provide high magnetic conductivity and low hysteresis to enhance magnetic field conduction and energy storage capabilities. General iron cores can have different shapes and structures, commonly including E-type, I-type, U-shaped, etc., used for electronic components such as inductors and transformers. The ignition coil core usually needs to have high magnetic conductivity, low hysteresis, and high heat resistance to meet the requirements of high-voltage ignition systems. Ordinary iron cores can be selected with different materials and characteristics according to specific application requirements.
