Abstracts

According to our (Global Info Research) latest study, the global Automobile Inductive Encoder market size was valued at US\$ 104 million in 2025 and is forecast to a readjusted size of US\$ 139 million by 2032 with a CAGR of 3.2% during review period.

In 2025, global production of automotive inductive encoders reached 1.1918 million units, with an average selling price of \$85 per unit. The global annual production capacity for automotive inductive encoders was approximately 1.5 million units, with a gross profit margin of approximately 26.2%. An automotive inductive encoder is a position and/or speed sensing device used in automotive systems. It operates based on the principle of induction (electromagnetism); when a mechanical target moves, the encoder's electrical response (e.g., inductance or inductive signal) changes. The sensor outputs an electrical signal (typically processed in pulse or digital format), which the vehicle controller uses to calculate rotation angle, position, or speed to achieve functions such as steering or motor control. The upstream of the automotive inductive encoder industry chain includes electronic and magnetic materials, enameled wire, and ADC/MCU, while the midstream consists of automotive inductive encoder manufacturers, and the downstream mainly comprises the commercial vehicle and passenger vehicle industries.
