The global Automobile Shock Absorber market size is expected to reach \$ 17840 million by 2032, rising at a market growth of 2.7% CAGR during the forecast period (2026-2032).

In 2025, Global automobile shock absorber production reached approximately 557,402 K units, with an average price of US\$25.6 per unit.

A shock absorber or damper is a mechanical or hydraulic device designed to absorb and damp shock impulses. It does this by converting the kinetic energy of the shock into another form of energy which is then dissipated. Most shock absorbers are a form of dashpot.

The intelligentization of vehicle suspension system mainly involves electronically controlled shock absorbers. The electronic control technology of suspension makes passive suspension develop towards semi-active suspension and active suspension. The electronically controlled suspension system is a new type of suspension structure that can meet the two mutually exclusive performance requirements of smoothness and maneuverability by controlling and adjusting the stiffness of the suspension and the damping of the shock absorber or other components. Its working principle is that the sensor collects the suspension vibration signal, vehicle driving status, road surface information and other data and transmits it to the controller. The controller returns the control signal to the actuator according to the designed control strategy, so as to adjust the damping properties and elastic coefficient of the suspension system in real time. With the rapid development of automotive electronic technology, the continuous enrichment of the functions of the electronic control unit module, the continuous reduction of the cost of sensors and controllers and the continuous improvement of

accuracy, it provides conditions for the application of electronically controlled suspension systems.

The electronically controlled air suspension system is a major breakthrough in the automotive suspension industry since the independent suspension was introduced. At present, the electronically controlled air suspension system has begun to be used in commercial vehicles and luxury cars in European and American countries. However, from a domestic perspective, compared with traditional passive suspension systems, electronically controlled suspensions have complex structures, high costs, difficult operations, and high energy consumption, which to some extent hinders the promotion and application of electronically controlled suspension systems. With the development of vehicle control technology, electronic control will gradually replace traditional mechanical control, and electronically controlled suspension will become a development direction of automotive suspension technology.
