Abstracts

The global Automobile Tire Recycling market size is expected to reach \$ 6578 million by 2032, rising at a market growth of 3.4% CAGR during the forecast period (2026-2032).

Automobile tire recycling refers to the resource-based treatment process of collecting, sorting, cutting, crushing, separating steel wires and fibers, processing rubber powder/granules, preparing recycled rubber, and pyrolysis or energy utilization of used automobile tires that have reached their service life, are no longer safe to drive, or are no longer suitable for retreading. It transforms used tires from solid waste into secondary resources that can re-enter the rubber, road, building materials, energy, and chemical industry chains. The upstream sector primarily includes waste tire recycling networks, auto repair and tire shops, fleets, end-of-life vehicle dismantling companies, logistics and recycling systems, crushing equipment, magnetic separation equipment, screening equipment, cryogenic pulverizing equipment, pyrolysis furnaces, and environmental treatment facilities. The midstream sector involves waste tire collection, testing and sorting, dismantling and crushing, steel wire and fiber separation, rubber powder refining, pyrolysis, and product quality control. The downstream sector serves road engineering, sports fields, rubber products, building materials, cement, energy, carbon black, chemicals, and tire companies. Gross profit margins range from approximately 20% to 35%.

Globally, the Asia-Pacific region is experiencing rapid growth in waste tire generation and recycling, primarily driven by increased vehicle ownership, infrastructure development, and rubber product demand in China, India, Japan, South Korea, and Southeast Asia. In the North American market, the US and Canada have mature recycling systems and a strong foundation for the utilization of rubber powder, TDF, rubber-modified asphalt, and civil engineering materials. Europe, driven by the EPR

system, circular economy policies, and high processing rates, is upgrading towards the utilization of recycled carbon black, pyrolysis oil, and high-value materials. In Latin America, countries like Brazil and Mexico are experiencing rapid demand growth. Future industry trends will focus on three main lines: first, upgrading from low-value crushing and fuel production to high-value products such as rubber powder, modified asphalt, reclaimed rubber, recycled carbon black, and pyrolysis oil; second, large tire companies, chemical companies, and professional recyclers will promote the reintroduction of materials into the tire and rubber product supply chain through closed-loop procurement, joint ventures, and recycling material certification; and third, stricter regulations, the EPR system, carbon emission reduction, and infrastructure investment will drive increased industry concentration, but transportation radius, dispersed waste tires, low-price competition, stable operation of pyrolysis projects, and end-material certification remain major limiting factors.
