Abstracts

According to our (Global Info Research) latest study, the global Automotive 3D Printing System market size was valued at USD 2881.1 million in 2022 and is forecast to a readjusted size of USD 9761.4 million by 2029 with a CAGR of 19.0% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

In the automotive industry, prototyping has been the most common 3D printing use case. Rapid prototyping has become almost synonymous with 3D printing due to the dramatic speed-up in prototyping using 3D printing, and the technology has revolutionized the product development process.

With 3D printing, automotive designers can rapidly create prototypes of physical parts or assemblies, ranging from simple interior elements and dashboards to scale models of entire vehicles. Rapid prototyping helps companies turn ideas into convincing proofs of concept. These concepts are then advanced into high-fidelity prototypes that closely match the end result, and ultimately guide the product through a series of validation stages, culminating in mass production.

In the past, products would go through several iterations, so prototyping was time-consuming and expensive. Using 3D printing technology, we can produce convincing and representative functional prototypes in a day at a cost far lower than traditional manufacturing methods. With desktop-grade 3D printers, engineering and design teams can bring 3D printing in-house to increase iteration cycles and shorten the distance between idea and final product, enhancing the overall product development workflow.
