Abstracts

According to our (Global Info Research) latest study, the global Automotive Active Damping System market size was valued at US\$ 247 million in 2024 and is forecast to a readjusted size of USD 663 million by 2031 with a CAGR of 15.3% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Automotive Active Damping System is an advanced suspension technology designed to improve vehicle handling, ride comfort, and stability by continuously adjusting the damping characteristics of the shock absorbers in real-time. Unlike traditional passive suspension systems, which rely on fixed damping characteristics, active damping systems dynamically adjust based on driving conditions, road surface, vehicle speed, and driver inputs.

Today the majority of new cars in the luxury and upper middle class range, including some Sport Utility Vehicles (SUVs) , have air suspension. The volume of the air in the air cushions in all corners of the car can be controlled. This is done by controlling the flow of the air in and out of the additional air reservoirs. The system includes a special air compressor, one or two air reservoirs, four shock absorber units with air springs and traditional shock absorbers, 2 to 5 stand-alone accelerometers and the electronic control unit (ECU) .
