According to our (Global Info Research) latest study, the global Automotive Aluminum Die-Cast Components market size was valued at US\$ 67615 million in 2025 and is forecast to a readjusted size of US\$ 81283 million by 2032 with a CAGR of -0.5% during review period.

In 2025, global production of Automotive Aluminum Die-Cast Components reached 12.74 million MT, with the global average market price at approximately 5,158 USD/MT, production capacity at around 21.28 million tons, and the industry average gross margin at 14.6%.

The main upstream raw materials include aluminum alloys and others.

Major upstream suppliers include Novelis, Norsk Hydro, UACJ, Constellium, Lizhong Sitong Light Alloys Group Co., Ltd., and others.

Downstream customers include GM, Volkswagen, Honda, BMW, BYD, Great Wall Motor, Toyota, and others.

Automotive Aluminum Die-Cast Components refer to lightweight metal components made primarily from aluminum alloys and formed through processes such as high-pressure die casting, low-pressure casting, gravity casting, squeeze casting, or vacuum die casting. These components are used in automotive powertrains, body structures, chassis systems, e-drive systems, battery systems, thermal management systems, steering systems, braking systems, and other vehicle areas. They feature low density, high specific strength, good thermal conductivity, corrosion resistance, and high forming

efficiency, enabling vehicles to reduce overall weight and improve energy efficiency while meeting requirements for structural strength, dimensional accuracy, and functional integration.

Automotive Aluminum Die-Cast Components include engine blocks, cylinder heads, oil pans, transmission housings, clutch housings, brackets, and other parts used in traditional internal combustion engine vehicles, as well as motor housings, electronic control housings, reducer housings, battery pack housings, battery trays, front compartment structural parts, rear floor structural parts, shock towers, and integrated body structural components used in new energy vehicles. With the increasing penetration of new energy vehicles, the application focus of Automotive Aluminum Die-Cast Components is gradually shifting from traditional powertrain components to e-drive systems, battery systems, body structural components, and large integrated die-cast components.

Automotive Aluminum Die-Cast Components typically involve multiple manufacturing steps, including mold design, melting and alloy preparation, die casting, cooling and solidification, gate removal, heat treatment, machining, surface treatment, inspection, and assembly. For high-safety-level products such as body structural components, battery housings, and load-bearing chassis parts, manufacturers also need capabilities in high-vacuum die casting, low-porosity control, heat treatment stability, dimensional deformation control, fatigue performance verification, and mass-production consistency management. Therefore, this industry is not merely a simple metal forming and processing sector, but also has strong comprehensive barriers in materials, molds, processes, equipment, and quality systems.
