Abstracts

The global Automotive Brake Friction Product market size is expected to reach \$ 12115 million by 2032, rising at a market growth of 3.5% CAGR during the forecast period (2026-2032).

Automotive brake friction products are engineered composite friction components installed in disc brake, drum brake and parking brake systems. They generate controlled friction against brake rotors or drums, converting vehicle kinetic energy into heat to achieve deceleration, stopping and parking functions. Core products include disc brake pads, brake linings, lined brake shoes and commercial-vehicle air disc brake pads. Major upstream inputs include phenolic or modified resins, mineral fibers, steel fibers, glass fibers, aramid fibers, graphite, barite, alumina, calcium carbonate, metallic powders, sulfides, friction powders, fillers, abrasives and adhesives. Finished products are manufactured through compounding, pre-forming, hot pressing, curing, grinding, coating, shim attachment and final assembly. They are used in passenger cars, SUVs, light commercial vehicles, heavy trucks, buses, trailers and special road vehicles.

In 2025, global automotive brake friction products production reached approximately 2 million tons, with an average global market price is \$4500 per ton.

From a global industry perspective, automotive brake friction product is a critical material category within vehicle chassis safety systems and the automotive aftermarket consumables chain. Core applications include disc brake pads, drum brake linings, commercial-vehicle brake linings, clutch facings and high-performance braking components. Performance is determined not by one raw material alone, but by formulation design, molding and curing process, backing-plate bonding, friction-pair matching and vehicle duty cycle. Vehicle mass, maximum speed, axle load, rotor

metallurgy, thermal management and NVH requirements differ substantially across passenger cars, light commercial vehicles, heavy trucks, hybrids and battery-electric vehicles, so OEM and aftermarket suppliers typically develop application-specific friction formulations.

In terms of technology routes, automotive brake friction products are commonly classified into non-asbestos organic (NAO), low-metallic, semi-metallic, ceramic and heavy-duty high-temperature formulations. The industry is moving toward low-copper or copper-free chemistry, lower dust, lower noise, lower wear, stronger thermal stability, better corrosion resistance, longer service life and automotive-grade consistency. The U.S. EPA's Copper-Free Brake Initiative set targets to reduce copper in brake pads to below 5% by weight in 2021 and to 0.5% by 2025, while also reducing mercury, lead, cadmium, asbestiform fibers and chromium-six salts. This has accelerated copper substitution and environmentally improved friction-material development. Low-copper and copper-free formulations generally require a redesigned balance of metal sulfides, minerals, ceramic particles, graphite, fibers and functional fillers to maintain friction stability, fade resistance, rotor wear performance and NVH behavior.

Electric and hybrid vehicles are changing the operating conditions of automotive friction materials rather than eliminating friction braking. Regenerative braking reduces the frequency of conventional brake use, which can reduce pad wear, but friction brakes remain necessary during emergency braking, high-speed stops, low-speed braking and conditions where regenerative braking is limited. Lower friction-brake usage can also increase risks related to rotor corrosion, material adhesion and brake noise, raising requirements for low-temperature braking response, corrosion resistance, low-noise performance, low drag and reliable friction-material-to-backing-plate bonding in EV and hybrid platforms.

The main growth drivers come from three areas. First, the global vehicle parc, aftermarket maintenance demand and commercial-vehicle service requirements continue to support replacement demand for brake pads, brake linings and clutch facings. Second, vehicle lightweighting, higher vehicle speeds, electrification and increasing intelligence are raising requirements for thermal stability, NVH control, durability and braking-system safety margins, pushing friction materials toward higher-performance formulations. Third, environmental regulation and concern over brake-related particulate emissions are accelerating the transition from traditional high-copper, high-metal-content and environmentally burdensome formulations toward low-copper, copper-free, low-dust, low-noise and more consistent material systems.
