Abstracts

A sensor is a device that detects changes in its environment by picking stimulus changes and sending this data to the system electronically. It is designed to detect physical, chemical, and process changes in an environment. A chassis sensor is ideally used to detect the wheel position to enable closed-loop chassis control. The chassis sensor is mounted between the chassis and the sprung components to measure the vehicle suspension travel. Other applications of chassis sensors include the pedal position, transmission gear selection, and adaptive headlight aiming systems.
