Abstracts

According to our (Global Info Research) latest study, the global Automotive Door Handle Antenna market size was valued at US\$ 2531 million in 2025 and is forecast to a readjusted size of US\$ 3689 million by 2032 with a CAGR of 5.6% during review period.

A automotive door handle antenna is an onboard antenna integrated inside or near the car door handle, primarily used to enable the vehicle's keyless entry system (PEPS), near-field communication, and some intelligent connectivity functions. It communicates with smart keys and mobile phone keys via low-frequency (LF) or high-frequency (RF) signals, enabling automatic unlocking when the owner approaches the vehicle and automatic locking when they leave. It is an important component of intelligent automotive electronics.

Car door handle antennas typically work in conjunction with the body control module (BCM) and the keyless entry system. When the owner approaches the vehicle with the smart key, the low-frequency antenna inside the door handle sends a wake-up signal; upon receiving the signal, the smart key returns authentication information via radio frequency (RF); after the system completes authentication, the vehicle automatically unlocks and allows starting.

The upstream sector primarily includes suppliers of basic raw materials and key components such as copper wire, magnetic materials, flexible printed circuit boards (FPC), RF chips, micro connectors, and plastic and metal structural parts. These provide structural support and the foundation for RF performance of antenna modules. The midstream sector consists of manufacturers of automotive door handle antennas

and keyless entry systems (PEPS). They are responsible for antenna design, RF calibration, module integration, and reliability testing, integrating the antenna with door handles, control modules, and in-vehicle electronic systems to form complete modules. The downstream sector mainly comprises OEMs and intelligent automotive electronics integrators, applying these technologies to passenger cars, new energy vehicles, and high-end intelligent models to achieve functions such as keyless entry, digital keys, intelligent welcome systems, and vehicle connectivity.

In 2025, global sales of automotive door handle antennas will reach 75 million sets, with a production capacity of approximately 105 million sets, an average selling price of US\$32.8 per set, and an average gross profit margin of 25%-40%.

The demand for automotive door handle antennas is primarily driven by intelligent systems, keyless entry (PEPS) systems, and digital key functionality. High-end passenger vehicles and new energy vehicles are the core growth markets, especially with the continued increase in the penetration rate of UWB digital keys and BLE/NFC integrated door handle antennas. Furthermore, intelligent welcome systems, vehicle networking functions, and high-security vehicle recognition applications are also driving demand for high-performance, low-power, and interference-resistant door handle antennas. In the future, with the rapid growth in new energy vehicle sales and the widespread adoption of in-vehicle intelligent electronic functions, the proportion of high-value-added modules will gradually increase, becoming the main source of market growth.

In terms of technological evolution, automotive door handle antennas are developing towards 'multi-frequency fusion, high integration, and intelligence.' Early products mainly used LF+RF basic communication, while the latest generation of products gradually incorporates UWB, BLE, and NFC functions to achieve high-precision positioning and digital key functionality. Packaging forms are also evolving from separate modules to built-in and hidden integration within the door handle to adapt to the streamlined design and waterproof/dustproof requirements of new energy vehicles. In the future, modular design and multi-antenna collaborative solutions will further improve recognition speed, anti-interference capabilities, and system stability, while reducing production costs.
