Abstracts

According to our (Global Info Research) latest study, the global Automotive Dry Air Filters market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Due to their materials and construction, the air flow of even the high-performance dry air filters will usually be less than an oiled filter of the same size. The upside to dry filters is that they require less maintenance. They aren't always reusable, since using water to clean them will damage the filter element. Their life can be extended by using compressed air to blow some of the dirt off, but that can only be done so many times. OEM dry filters are generally effective up until 10,000 to 15,000 miles (check your service manual), then they must be replaced. Dry filters are commonly used in vehicles that are driven in drier, dustier climates, where airborne contaminants are way more plentiful than in wetter climates. Many people run dry filters in these environments because there is usually so much dust, that an oiled filter would need to be cleaned constantly.
