## Abstracts

The global Automotive Ecall market size is expected to reach \$ 6542 million by 2032, rising at a market growth of 9.6% CAGR during the forecast period (2026-2032).

In 2024, global automotive eCall production reached approximately 28582.8 K units, with an average global market price of around US\$ 106.1 per unit.

The automotive eCall (Emergency Call) system, launched by the European Union, is an emergency call system for vehicle accidents. It is primarily used to automatically or manually initiate a call for assistance to a Public Safety Answering Point (PSAP) in the event of a vehicle accident or an emergency, and to provide relevant information such as the vehicle's location. The eCall (Emergency Call) system, launched by the European Union, is primarily used to automatically or manually initiate a call for assistance to a Public Safety Answering Point (PSAP) in the event of a vehicle accident or an emergency, and to provide relevant information such as the vehicle's location. The T-Box, known as the in-vehicle intelligent terminal, is the only control unit in the vehicle body that can connect to the internet. It is responsible for monitoring and controlling the vehicle's status. Its greatest value lies in its connectivity to the network. The eCall system is integrated into the T-Box.

**Global eCall Standard Harmonization:** As countries around the world gradually implement emergency call systems similar to eCall, international communication standards are gradually being unified. Future eCall devices will not only support the EU's 112 number but may also support multiple global emergency call platforms to ensure compatibility and responsiveness across regions.

**Cross-Platform Information Sharing:** Through unified standards and cross-regional data sharing protocols, eCall systems may be able to seamlessly integrate with emergency

service systems in different countries, providing more reliable emergency responses for drivers worldwide.

**Collision Prediction and Active Safety System Integration:** Future eCall systems may not only passively respond to accidents but also be deeply integrated with onboard active safety systems (such as autonomous driving, lane keeping, and automatic braking). Before an accident occurs, the system will be able to detect potential collisions using onboard sensors and send advance alerts to emergency services.

**In-Vehicle Sensor Integration with eCall:** As vehicles are equipped with more sensors (such as radar, lidar, and cameras), eCall devices may integrate data from these sensors to provide more accurate accident analysis and rescue needs. This technological integration can improve the efficiency and accuracy of rescue services in the event of an accident. **5G Technology:** With the widespread adoption of 5G technology, future eCall systems may transmit information to emergency services via higher-speed, lower-latency network connections. This not only speeds up emergency call responses but also enables the transmission of more data (such as vehicle status and driver health information) at the scene of an incident, providing rescue teams with more real-time information.

**V2X (Vehicle-to-Everything) communication technology:** The application of V2X (Vehicle-to-Everything) communication technology will enable eCall to move beyond vehicle-to-vehicle and vehicle-to-infrastructure communications. It will also enable information sharing between vehicles and systems such as road networks and emergency response centers, enabling more intelligent traffic management and incident response.
