Abstracts

Elastomers are unstructured polymers prevailing beyond their glass transition temperatures such that significant motion is possible. Elastomers have very low intermolecular strength, low modulus of elasticity, and high strain of failure as compared to other materials. Carbon, hydrogen, oxygen and silicon monomers link to form the polymer, which eventually forms elastomers. There are two major elastomers used in automotive applications: synthetic and thermoplastic. Automotive elastomers are used in the production of components that need to withstand extreme temperatures such as hoses, insulators, seals, bushes, engine mounts, and gaskets.

Scope of the Report:

This report focuses on the Automotive Elastomers in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

The tire application is projected to lead the automotive elastomers market during the forecast period. Because of the implementation of stringent environmental regulations regarding emission levels, vehicle design has been changing drastically over the past few decades.

The worldwide market for Automotive Elastomers is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
