Abstracts

Energy-absorbing foams are widely used in the automotive industry to prevent injuries to the occupants in the event of front or side collisions. The use of foamed materials results in a significant improvement in the passive safety of the vehicle, owing to their excellent energy dissipation properties. In addition, they have low apparent density and are relatively cheap, allow great design flexibility, as they can be easily modeled in complex geometric parts. Typical applications include seat cushions, bumper systems, instrument panels and side protection systems. Effort is currently underway to minimize occupant head injury during an impact. The severity of injuries can be prevented or at least mitigated by the use of structural foams as cushioning.
