A Fully Active Suspension System is a high-performance automotive suspension technology that uses electronic controls and hydraulic systems to actively adjust the height, damping, and body posture of each wheel, thereby improving handling performance and comfort. This system can dynamically adjust the suspension's stiffness and height in real-time based on road conditions, driving behavior, and vehicle dynamics, providing a better ride experience, reducing vibrations and bumps, and optimizing handling. Unlike semi-active suspension systems, a fully active suspension system has complete active control capabilities, allowing it to actively change the dynamic characteristics of the wheels and the posture of the vehicle.
