## Abstracts

According to our (Global Info Research) latest study, the global Automotive Inductive Wireless Charging Systems market size was valued at USD 202.6 million in 2023 and is forecast to a readjusted size of USD 2485.3 million by 2030 with a CAGR of 43.1% during review period.

Electric vehicles are gaining importance in modern times because of the rise in global fuel prices and alarming levels of air pollution. There is widespread concern about the negative effects of global warming. In such a scenario the rapid adoption of electric vehicles is seen as the most viable solution. The time taken to charge electric vehicles was one of the major concerns, but with the advent of wireless inductive charging this issue has been resolved. Inductive wireless charging is considered a major breakthrough as it has made the use of plugs and cords redundant. Inductive charging takes place when an electromagnetic field transfers energy between two coils.

### Advantages

Protected connections – No corrosion when the electronics are all enclosed, away from water or oxygen in the atmosphere. Less risk of electrical faults such as short circuit due to insulation failure, especially where connections are made or broken frequently.

Low infection risk – For embedded medical devices, transmission of power via a magnetic field passing through the skin avoids the infection risks associated with wires penetrating the skin.

Durability – Without the need to constantly plug and unplug the device, there is

significantly less wear and tear on the socket of the device and the attaching cable.

Increased convenience and aesthetic quality – No need for cables

#### Disadvantages

Slower charging – Due to the lower efficiency, devices take longer to charge when supplied power is the same amount.

More expensive – Inductive charging also requires drive electronics and coils in both device and charger, increasing the complexity and cost of manufacturing.
