## Abstracts

According to our (Global Info Research) latest study, the global Automotive Integrated Air Spring market size was valued at US\$ 1564 million in 2024 and is forecast to a readjusted size of USD 1986 million by 2031 with a CAGR of 3.5% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The integrated air spring offers substantial advantages over traditional steel spring structures, especially in terms of driver comfort and safety. It is commonly utilized in axle, cab, and driver seat suspension systems. The technology features a significantly reduced natural frequency, along with the ability to individually adjust stroke height and spring travel, enhancing both ride quality and performance.

Within the secondary suspension between the bogie and the vehicle body, our air spring systems provide for the flexible mounting of the vehicle body. Air springs have a low natural frequency, which minimizes the transmission of vibrations. They decouple it from the majority of track irregularities, while also allowing the bogie to turn as the train negotiates bends.
