An automotive active health monitoring system is an automotive technology, which monitors the health of the driver. The automotive active health monitor system is an in-vehicle health monitoring system, which measures and detects the driver's vital health parameters and biophysical attributes such as respiration rate, blood pressure, pulse, oxygen saturation, and other key health information. It also measures and senses consciousness and drowsiness of the driver while driving. The automotive active health monitoring system utilizes sensors and infrared cameras to detect and monitor human face expressions and health information.

Automotive is a key driver of this industry. According to data from the World Automobile Organization (OICA), global automobile production and sales in 2017 reached their peak in the past 10 years, at 97.3 million and 95.89 million respectively. In 2018, the global economic expansion ended, and the global auto market declined as a whole. In 2022, there will wear units 81.6 million vehicles in the world. At present, more than 90% of the world's automobiles are concentrated in the three continents of Asia, Europe and North America, of which Asia automobile production accounts for 56% of the world, Europe accounts for 20%, and North America accounts for 16%. The world major automobile producing countries include China, the United States, Japan, South Korea, Germany, India, Mexico, and other countries; among them, China is the largest automobile producing country in the world, accounting for about 32%. Japan is the

world's largest car exporter, exporting more than 3.5 million vehicles in 2022.
