## Abstracts

The global Automotive LCD Display Module market size is expected to reach \$ 8651 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

An Automotive LCD Display Module is a liquid crystal display used in vehicles to present visual information such as speed, navigation, entertainment, rear-view camera images, and system status. These screens are commonly found in instrument clusters, center consoles, head-up displays, and rear-seat entertainment systems. Designed to withstand harsh automotive conditions, they feature high brightness, wide temperature tolerance, vibration resistance, and anti-glare or anti-reflective coatings for visibility in sunlight. Automotive LCDs come in various technologies such as TFT (Thin-Film Transistor), IPS (In-Plane Switching), and LTPS (Low-Temperature Poly-Silicon), offering high resolution and energy efficiency to enhance both driver safety and user experience.

Annual shipments of this product are less than 100 million pieces. The price per unit of LTPS LCD products is higher than that of traditional a-Si LCD products, with an average selling price of approximately US\$70 per piece. The gross profit margin for this product is between 15% and 20%.

The upstream of the Automotive LCD Display Module market mainly includes raw material and component suppliers, such as glass substrates, polarizers, backlight units (BLUs), driver ICs, and liquid crystal materials, along with TFT array and module manufacturers who assemble display panels.

The downstream consists of automotive OEMs and Tier-1 suppliers (e.g., Continental, Denso, Bosch, and Visteon) who integrate these LCD modules into vehicle systems such as instrument clusters, infotainment displays, and head-up displays. Ultimately, the displays are delivered to automobile manufacturers for installation in passenger cars, commercial vehicles, and EVs, where they enhance driver information, connectivity, and

user experience.

Automotive LCD Display Modules are evolving from single infotainment screens into integrated cockpit surfaces—notably pillar-to-pillar dashboards and panoramic layouts—as OEMs use display real estate to differentiate software-defined interiors and passenger experiences. Within LCD, the value is shifting away from commodity a-Si panels toward automotive-grade LTPS TFT LCD (higher resolution, thinner form factors, better integration) and toward Mini-LED local dimming (sometimes with QD films) to approach OLED-like contrast while retaining LCD's strengths in brightness, lifetime, and burn-in risk—a path already showing up in mass-produced vehicles and forecast commentary from display analysts. The competitive landscape is intensifying as major panel makers (notably across Korea/China/Taiwan/Japan) expand automotive focus and pair panels with touch/cover-glass, optical bonding, and cockpit integration capabilities. At the same time, safety and distraction pressure is rising—EU rules mandate advanced driver-distraction warning for new vehicle types from 2024, and Euro NCAP's direction of travel rewards designs that reduce eyes-off-road time—so HMI design is becoming as important as display hardware, pushing OEMs toward clearer, simpler UI and hybrid control strategies even as screens grow.
