## Abstracts

According to our (Global Info Research) latest study, the global Automotive Leaded Disk Varistors market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Automotive leaded disk varistors are electronic components that are used to protect automotive electronic systems from transient voltage spikes and surges. These varistors are designed to clamp voltage surges to safe levels and help prevent damage to sensitive electronic components.

Automotive Leaded Disk Varistors are typically made from a ceramic material that contains zinc oxide. The ceramic material is then formed into a disk shape and coated with a conductive material on both sides. The disk is then encapsulated in a plastic or epoxy material and fitted with two leads for connection to the automotive electronic system.

These varistors are commonly used in automotive applications such as engine control modules, airbag systems, and electronic stability control systems. They are designed to withstand high operating temperatures and harsh environmental conditions commonly found in automotive applications.
