Abstracts

According to our (Global Info Research) latest study, the global Automotive Lubricant Coating market size was valued at US\$ 161 million in 2025 and is forecast to a readjusted size of US\$ 279 million by 2032 with a CAGR of 8.3% during review period.

In 2025, global automotive lubricant coating production reached approximately 891 tons, with an average global market price of around \$175 per kilogram. In 2025, the global 's total production capacity of automotive lubricant coating reached 1,113 tons. The industry average gross profit margin of this product reached 27%.

Automotive lubricating coatings are functional coating materials applied to the surfaces of automotive parts. They form a thin film on metal, plastic, or composite surfaces, possessing low friction coefficients, self-lubricating properties, wear resistance, anti-seize properties, and corrosion resistance. This reduces frictional resistance and wear during component operation, improves mechanical efficiency, extends service life, and reduces reliance on lubricating oil. Automotive lubricating coatings typically utilize polytetrafluoroethylene (PTFE), molybdenum disulfide (MoS₂), graphite, polyimide (PI), polyamide-imide (PAI), PTFE composites, and various organic or inorganic solid lubricant systems. They are widely used in engines, transmissions, chassis systems, steering systems, braking systems, electric drive systems for new energy vehicles, and various fasteners and moving parts.

The upstream of the automotive lubrication coating industry chain mainly includes suppliers of specialty resins, solid lubricants, solvents, additives, pigments and fillers, as well as spraying, dip coating, electrophoresis, and curing equipment. The midstream comprises lubrication coating material manufacturers and professional surface

treatment service providers, responsible for formulation development, coating preparation, surface pretreatment, coating application, and quality inspection. The downstream includes vehicle manufacturers, engine manufacturers, transmission manufacturers, electric drive system suppliers, and automotive parts companies. With increasing demands for lightweighting, electrification, and high efficiency in automobiles, lubrication coatings have become a crucial technical means to improve component performance and meet energy conservation and emission reduction requirements.

The global automotive lubrication coating market is expected to maintain stable growth in the future. On the one hand, traditional gasoline vehicles continue to demand wear resistance and friction reduction for engines, transmissions, and chassis systems. On the other hand, the rapid development of new energy vehicles has spurred new application scenarios such as motor bearings, reducer gears, battery structural components, and high-voltage connectors, continuously increasing the demand for low-friction, high-durability, and maintenance-free lubrication coatings. Simultaneously, increasingly stringent energy conservation and emission reduction regulations in various countries, coupled with OEMs' continuous pursuit of reducing friction loss and improving energy efficiency, make lubrication coatings a key direction for optimizing the performance of automotive components. In the future, high-temperature resistant, PFAS-free environmentally friendly systems, water-based formulations, and new solid lubricant coatings suitable for electric vehicle operating conditions will become the main growth drivers in the industry.
