Abstracts

According to our (Global Info Research) latest study, the global Automotive mmWave Radar ICs market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Millimeter waves refer to electromagnetic waves with a length of 1 to 10 mm, corresponding to a frequency range of 30 to 300 GHz. As a spectrum between microwaves and far-infrared waves, millimeter waves have high spatial resolution and are less affected by weather, and can provide data such as distance, speed and angle. Millimeter-wave radar, lidar, and cameras together form the current composite perception system for autonomous driving. The former plays a stabilizing role in it—it can provide high penetration and strong ranging capabilities regardless of weather conditions.

Compared with other types of automotive sensor chip products, the detection performance of Automotive mmWave Radar ICs is stable, and it is not easily affected by the surface shape, color and atmospheric airflow of the detection object. It has the characteristics of strong environmental adaptability. It also works better. However, its cost is relatively high compared with cameras and ultrasonic radars, and the reflected waves of pedestrians are weak and difficult to detect.
