## Abstracts

Automobile piston compression rings are a type of internal combustion engine piston rings. They are located in the groove on the top of the piston. Their main function is to seal the space between the piston and the cylinder wall to prevent gas from leaking from the combustion chamber to the crankcase. It also helps To transfer heat and keep lubricating oil clean. Automotive piston compression rings are usually made of metal materials, such as cast iron, chromium alloy steel, etc., to ensure their stability and wear resistance under high temperatures and pressures. Its cross-section is usually a thin and flat ring-shaped structure with a certain degree of elasticity, which can form an effective seal between the piston and the cylinder wall.

According to our (Global Info Research) latest study, the global Automotive Piston Compression Ring market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
