Abstracts

The automotive piston mostly functions by transferring force from the expanding gas in the cylinder to the crankshaft via the piston rod or with the help of connecting rod, which produces the required power to drive the shaft and consequently the automobile. The automotive piston consists of piston rings which restrict the leakage of gas. The piston also acts as a valve in some engines for ports in the cylinder wall. A piston facilitates the intake, compression, combustion, and exhaust stroke of an IC engine. The piston moves in upward and downward motion inside an engine cylinder. The motion transmits the energy into the camshaft connected between cam and the piston. The power is transferred from the engine cylinder causing the movement of the vehicle.
