Abstracts

Combining a plastic resin with colors, additives, modifiers, fillers, reinforcements or other polymers has become a common practice, as about half of the plastic consumed in the world cannot be used as base resin. The compounding process is used to convert base resin into desired plastic that is more uniform, effective, and usable across varied applications. Plastics have traditionally been used in various applications such as automotive components, packaging, toys, furniture, electronic components, and construction materials. Manufacturing of plastic compounds entails three ingredients or raw materials: polymers, additives, and fillers. Polymers primarily comprise polypropylene and polyethylene. Polypropylene may be categorized into homopolymers or block copolymers. Prices of plastics have been on the rise in the past few years owing to instability in prices of petrochemicals and higher substitution potential of their bio-based counterparts.

Scope of the Report:

This report focuses on the Automotive Plastic Compounding in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Increasing use of thermosets and thermoplastics in automotive component manufacturing is a key factor anticipated to fuel industry growth. Integration of electronics in automobiles has led to high demand for plastics in instrument panels with integrated high-end electronic devices. Plastic compounds offer high safety & electrical insulation when compounded with additives, thereby being preferred over base resins.
