Abstracts

A composite is defined as a multiphase material that exhibits a significant proportion of properties of both constituent phases. It usually consists of a continuous phase, called the matrix, and a dispersed phase called the reinforcement. Polymer matrix composite is polymer-based reinforced material that is used in various end-use industries such as construction, transportation, oil & gas, sports, energy, aerospace, consumer goods, and electrical & electronics. The automotive industry is a prominent end-use industry for polymer composites. Various resins such as polypropylene, polycarbonates, polyamides, acrylonitrile-butadiene styrene, and other engineered plastics are employed, along with reinforcing fibers, to manufacture automotive polymer matrix composite. The global automotive polymer composites can be segmented into fiber used and application areas in the automotive industry. The most commonly used fibers for automotive application are carbon fiber and glass fiber. The carbon fiber reinforcement possesses diverse mechanical and physical characteristics such as a high strength to weight ratio and corrosion resistance. These properties allow it to be utilized to make lightweight and strong components. However, glass reinforcement is majorly produced due to its relatively low cost and competitive physical and mechanical characteristics.
