Abstracts

According to our (Global Info Research) latest study, the global Automotive Polymers market size was valued at US\$ 47618 million in 2025 and is forecast to a readjusted size of US\$ 62459 million by 2032 with a CAGR of 4.0% during review period.

Automotive polymers refer to polymer-based materials that are polymerized, formulated, reinforced, filled, toughened, flame-retarded or configured as reactive systems to meet the mechanical, durability, processability, safety, lightweighting and regulatory requirements of passenger cars and road-going commercial vehicles. These materials are supplied as base resins, engineering resin grades, compounded pellets, powders, liquid polyurethane systems or other processable material forms and are used in the production of automotive interiors and exteriors, body and structural parts, powertrain components, electrical and electronic systems, high-voltage connectors, battery systems, thermal-management components, lighting systems, seating and noise, vibration and harshness components.

The automotive polymer market is a mature materials industry undergoing sustained internal upgrading rather than a newly emerging market driven solely by vehicle production. Global motor-vehicle output increased from 92.7 million units in 2024 to 96.4 million units in 2025, providing a broader demand base for automotive materials, but medium-term market growth will increasingly depend on material value per vehicle rather than unit production alone.

Electrification is the most important factor reshaping the application mix of automotive polymers, although it does not create uniform growth across all material categories. The International Energy Agency reported that global electric-car sales increased by more

than 20% to exceed 20 million units in 2025, representing approximately one-quarter of all new cars sold. Sales are expected to reach 23 million units in 2026, or 28% of global car sales. Nearly 22 million electric cars were produced in 2025, with China accounting for close to three-quarters of global production. This transition increases material demand in high-voltage connectors, battery modules and enclosures, busbar supports, electric-drive systems, charging equipment, thermal-management components, sensors and electrical insulation systems. These applications favour PPA, PPS, PBT, PA, PC, flame-retardant polypropylene compounds, TPV, TPU and specialised polyurethane systems. At the same time, certain materials used in fuel-delivery systems, air-intake systems and conventional internal-combustion powertrains face structural pressure.

From a product-development perspective, commodity polyolefins are being upgraded through mineral filling, long-glass-fibre reinforcement, density reduction, low-emission formulations and higher recycled content. Engineering plastics are evolving towards higher heat resistance, high CTI, halogen-free flame retardancy, lower moisture absorption, thin-wall mouldability and long-term colour stability. In 2025, BASF introduced a halogen-free flame-retardant PA9T grade for electric-vehicle high-voltage connectors, targeting electrical insulation, resistance to contact corrosion and stable orange colour under heat ageing. Celanese has also worked with automotive manufacturers on low-formaldehyde-emission POM, illustrating the increasing importance of cabin air quality, odour and emissions control. Polyurethane innovation is extending beyond conventional seating comfort into battery thermal protection, structural interfaces, acoustic management, lightweight foams and integrated reactive-moulding processes.

In June 2026, the Council of the European Union formally adopted new vehicle-circularity rules under which at least 15% of plastic used in new vehicles must come from recycled sources six years after the regulation enters into force, rising to 25% after ten years; at least 20% of the recycled plastic must originate from end-of-life vehicles. These requirements will raise the importance of feedstock traceability, batch consistency, contaminant and odour control, durability, colour management, carbon-data disclosure and renewed OEM qualification. Competitive advantage in recycled automotive polymers will therefore depend less on access to inexpensive waste and more on the ability to convert heterogeneous waste streams into repeatable, certified materials suitable for safety-critical and appearance-sensitive automotive applications.
