Abstracts

A sealant is a viscous material which penetrates by capillary action into a substrate where it is applied and provides a barrier to air, dust, liquids and others, from passing from one substrate to another. Sealants are corrosion resistant, insoluble in most media and have adhesion. The adhesion of sealants is slightly lower compared to adhesives. Sealants lie between high strength adhesives and low strength caulks and putties. However, they have higher elongation compared to adhesives. There are numerous types of sealants which are used across various industries such as building & construction, automobiles, rubber industry and marine applications among others.
