The global Automotive Seat Lift Motor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Automotive seat lift motor is a device that is used to control the position of a car seat. It is typically used in vehicles that have power seats, which allow the driver or passenger to adjust the position of the seat with the push of a button.

The motor is usually located under the seat and is connected to a series of gears and cables that move the seat forwards, backwards, or up and down. It is powered by the car's electrical system and is controlled by a switch or button on the seat itself or on the dashboard.

In addition to making it easier for drivers and passengers to adjust their seating position, seat lift motors can also be used to help people with disabilities or mobility issues get in and out of their cars more easily. Some models of seat lift motors include additional features such as heating and cooling, massage functions, and memory settings that allow users to save specific seat positions and recall them later.

This report studies the global Automotive Seat Lift Motor production, demand, key manufacturers, and key regions.
