Abstracts

The global Automotive Seat Lifters market size is expected to reach \$ 6805 million by 2032, rising at a market growth of 3.9% CAGR during the forecast period (2026-2032).

Automotive seat lifters are key components installed in the seat frame. They adjust seat height by changing the angle of the four-bar linkage in the seat pan, providing optimal visibility and comfort for drivers and passengers, while also improving driving safety.

Core functions of automotive seat lifters include overall height adjustment (typically 50-120mm travel), independent front and rear height adjustment (in some high-end models), partial front height adjustment (improving leg support), and memory position storage (integrated with smart cockpits).

Upstream key components of automotive seat lifters include the core drive system (permanent magnet bidirectional DC motor, reducer, position sensor), transmission mechanism components (lead screw/worm gear, rack and pinion, four-bar linkage), and electronic control system (ECU controller, switch panel), etc. Downstream applications are mainly in the OEM and aftermarket.

In 2025, global automotive seat lifter sales reached 71.84 million units, with a production capacity of approximately 90 million units. The average selling price was \$70.5 per unit, and the average gross profit margin was 25%-30%.

This report studies the global Automotive Seat Lifters production, demand, key manufacturers, and key regions.
