The automotive steering wheel adjustment motor is a small electric motor that is used to adjust the position of the steering wheel in a vehicle. The motor is typically located in the steering column and is controlled by a module located on the steering wheel. When the driver presses a button on the steering wheel to adjust the position of the steering wheel, the module sends a signal to the motor, which then moves the steering wheel up or down, in or out, or to the left or right. This allows the driver to find a comfortable driving position, which can improve safety and reduce fatigue. The motor is typically powered by the vehicle's electrical system and is designed to last for the life of the vehicle.
