According to our (Global Info Research) latest study, the global Automotive Thick-film Paste market size was valued at US\$ 557 million in 2025 and is forecast to a readjusted size of US\$ 855 million by 2032 with a CAGR of 6.4% during review period.

Automotive thick-film paste refers to a family of thick-film functional pastes used in automotive electronics and in-vehicle heating, sensing, and power-related modules. The system typically includes conductive, resistive, dielectric/insulating, and protective-layer materials, which are screen-printed or otherwise deposited on ceramic, glass, stainless-steel, aluminum, or polymer substrates and then cured or fired to form conductive, heating, insulating, sensing, or protective layers. Its key characteristic is suitability for high temperature, vibration, humidity, corrosion, and long-life automotive environments.

On the supply chain, upstream inputs include silver, gold, palladium, platinum, copper, nickel, ruthenium, and other metal powders, together with glass frits, inorganic oxides, resins, solvents, and ceramic/metal/glass/polymer substrates. Downstream demand flows into window heaters/defoggers, seat and cabin heaters, sensors, hybrid microcircuits, passive components, power control, and battery thermal-management applications.

In 2025, global automotive thick-film paste for electric vehicles production reached approximately 1200 tons, with an average global market price is \$450 per kilogram.
