An automotive turbine heat shield is a heat protection shield used around a turbocharger, usually made of metal or ceramic materials. Its main function is to reduce the impact of heat from the engine on the turbocharger and help maintain the turbocharger's operating temperature within the appropriate range. Turbochargers generate a lot of heat when operating, especially at high speeds, so effective insulation measures are required to avoid overheating and heat conduction to surrounding components. The design of the turbine heat shield can reduce the temperature in the engine compartment and reduce the impact of turbine heat on other components in the engine compartment.
