Abstracts

The global Automotive Wound Transformers market size is expected to reach \$ 10776 million by 2032, rising at a market growth of 3.8% CAGR during the forecast period (2026-2032).

Automotive wound transformers are electrical transformers specifically designed for vehicle electronic systems. Their basic structure consists of primary and secondary windings wound on a magnetic core, enabling the conversion of voltage, current, or impedance through electromagnetic induction. They are widely used in automotive DC-DC converters, on-board chargers (OBC), motor control modules, and in-vehicle infotainment systems to provide energy transfer, isolation, and filtering, enhancing system stability and reliability. Design considerations include rated voltage, current, turns ratio, operating frequency, insulation class, core material, temperature rise, and efficiency, while meeting automotive requirements such as high temperature, vibration tolerance, long-term reliability, and automotive certifications (e.g., AEC-Q200).

Automotive wound transformers are critical components in modern intelligent vehicle power systems.

The upstream of the industry chain mainly includes suppliers of raw materials such as magnetic materials (e.g., silicon steel sheets, ferrite, amorphous/nanocrystalline materials), conductors (copper wire, enameled wire), insulation materials, and encapsulating resins. It also includes suppliers of winding equipment and testing instruments, providing a fundamental guarantee for transformer manufacturing. The midstream consists of transformer design and manufacturing companies, responsible for primary and secondary winding design, core assembly, insulation treatment, encapsulation, and performance testing. Their products cover wound transformers for automotive DC-DC converters, on-board chargers (OBCs), motor control modules, and

in-vehicle infotainment systems. The downstream consists of OEMs and automotive electronics module manufacturers, who impose stringent requirements on wound transformers regarding electrical isolation, efficiency, temperature resistance, vibration resistance, and long-term reliability to ensure the stability, efficiency, and safety of power systems for new energy vehicles and intelligent vehicles.

In 2025, global sales of automotive wound transformers reached 125 million units, with a production capacity of approximately 170 million units. The average selling price was \$65 per unit, and the average gross profit margin was 20%-30%.

The demand for automotive wound transformers primarily stems from automotive DC-DC converters, on-board chargers (OBCs), motor control modules, infotainment systems, and ADAS modules. High-voltage platforms and bidirectional power feedback systems in new energy vehicles are the core drivers of growth, while the demand for filtering and EMI suppression in intelligent driving and in-vehicle infotainment systems continues to grow. Overall, the trends of automotive electrification and intelligentization are the main drivers of market demand growth.

Automotive wound transformer technology is evolving towards higher efficiency, lower losses, higher power density, miniaturization, and modular packaging. Low-frequency automotive power systems often use silicon steel sheets or ferrite cores, while high-frequency switching power supplies and DC-DC modules utilize ferrite or nanocrystalline cores to achieve high frequency and high power density. In terms of packaging, surface mount technology (SMD), multi-winding coupling, and modular design are gradually becoming mainstream to save PCB space and meet automotive-grade requirements for high temperature, high vibration, and long-term reliability.
