## Abstracts

The global Autonomous Smart Stroller market size is expected to reach \$ 406 million by 2032, rising at a market growth of 10.0% CAGR during the forecast period (2026-2032).

The autonomous smart stroller is an intelligent childcare device that integrates autonomous driving, environmental perception, and artificial intelligence technologies. By equipping the stroller with sensors, high-precision positioning modules, and a main control unit, it can achieve functions such as automatic route planning, intelligent following, autonomous obstacle avoidance, and point-to-point navigation. Its core goal is to free the caregiver's hands while ensuring the safety and comfort of the baby, providing advanced assistance features such as automatic cruising within parks, one-button return, and smart soothing to sleep. It is a cutting-edge consumer product under the concept of smart childcare.

As an emerging cross-disciplinary product, the prospects of the autonomous smart stroller are closely linked to the civilian adoption of autonomous driving technology and the demand in the smart childcare market. In the short term, it targets the high-end maternal and infant market as well as specific closed communities, establishing an early user base by addressing actual pain points of caregivers. The medium- to long-term development highly depends on the maturity of core technologies and cost reduction, such as more reliable sensor fusion solutions, more accurate semantic understanding, and improvements in relevant safety regulations. It is expected to evolve from a pioneering concept into an integral part of the future smart home and smart community ecosystem, becoming an important branch of intelligent mobility and domestic service robots.
