Abstracts

According to our (Global Info Research) latest study, the global Autonomous Soil Health Monitoring System market size was valued at US\$ 659 million in 2025 and is forecast to a readjusted size of US\$ 980 million by 2032 with a CAGR of 5.9% during review period.

Autonomous soil health monitoring system is intelligent system that integrate sensors, IoT, AI, and automation technologies. They are capable of collecting, analyzing, and transmitting key soil health indicators continuously and in multiple dimensions over long periods, without human intervention. Demand stems from the urgent global need for sustainable and intensive agriculture, land degradation remediation, and climate change mitigation. At its core, these systems quantify and manage soil as a living system through data-driven approaches. The upstream supply chain includes high-end sensor manufacturers (responsible for core probes such as electrochemical, spectral, and biosensors), precision electronics and communication module suppliers (edge computing gateways, low-power chips, and wireless modules), and algorithm and software developers (providing AI soil models and data platforms). Downstream, these systems directly serve large-scale farms, government agricultural and environmental departments, research institutions, land reclamation, and large horticultural enterprises. The ultimate goal is to achieve a paradigm shift from "sensing soil condition" to "managing soil health," providing continuous scientific evidence for decisions such as precision fertilization, water-saving irrigation, and carbon sequestration and emission reduction. By 2025, the production volume of autonomous soil health monitoring system is estimated at 80,000 units, with an average selling price of approximately US\$8,000 per unit and a gross profit margin of approximately 35%.
