Abstracts

According to our (Global Info Research) latest study, the global Autonomous Stroller market size was valued at US\$ 204 million in 2025 and is forecast to a readjusted size of US\$ 348 million by 2032 with a CAGR of 8.0% during review period.

Autonomous strollers are intelligent childcare devices integrating environmental perception, path planning, and automatic control technologies. By incorporating sensors and control units within the stroller, they can move autonomously, intelligently follow, automatically avoid obstacles, and cruise at designated points, all within a preset safe area or when the caregiver is locked in place. Their core objective is to partially free caregivers' hands while ensuring the baby's safety and comfort, providing an innovative solution that blends convenience and technology for modern childcare.

The development prospects of autonomous strollers are closely linked to the civilian application of autonomous driving technology and the expansion of the intelligent childcare market. In the short term, they are primarily positioned in the high-end consumer market and specific closed scenarios, establishing an early user base by addressing the actual pain points of caregivers. Their long-term development heavily depends on the maturity and cost reduction of core sensors and algorithms, as well as the improvement of relevant safety standards and regulations. It is expected that they will gradually integrate into the future smart home ecosystem, evolving from a pioneering concept product into a potential branch of personal short-distance intelligent mobility and service robots.
