Abstracts

Autopilot system is an important part of the flight management system. It is further used for controlling a vehicle eliminating the need for a human operator for constant monitoring. However, this system does not replace the complete need of a human operator, as an alternative, it helps them in operating the vehicle efficiently. These systems are extensively used in ships, spacecraft, missiles, and aviation. An autopilot system comprises components such as an actuator, computer, and mode selector or programmer. A mode selector or programmer enables the pilot to accordingly program the autopilot system in order to attain the desired flight profile and aids in communicating with avionic systems such as GPS. In this system, the computer receives the programmer information and then transmits it to the actuator. These autopilot systems are designed for the purpose of decreasing the workload of the cockpit and improving the ability of the pilot to control the flight.
