## Abstracts

The global Auxiliary Photosensitive Chemicals market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Auxiliary photosensitive chemicals refer to auxiliary chemicals used in image photosensitive materials to improve the performance and quality of photosensitive materials. These chemicals are often added to the formulation of photosensitive materials to achieve specific functions and effects. There are many types of auxiliary photosensitive chemicals. Common ones include: 1. Photosensitivity enhancer: used to improve the photosensitivity and sensitivity of photosensitive materials and enhance the sensitivity of photosensitive agents to light. 2. Contrast enhancer: used to improve the contrast of images and enhance the details and clarity of images. 3. Anti-pollution agent: used to reduce pollution and impurities during the preparation and use of photosensitive materials. 4. Anti-fading agent: used to improve the stability and durability of photosensitive materials and prevent image fading and fading. 5. Rheology modifier: used to adjust the rheological properties of photosensitive materials to make them easier to coat and process. In addition, there are some additive photosensitive chemicals with special functions, such as optical anti-reflection agents, anti-reflective agents, antistatic agents, etc., used to improve optical performance and surface properties. The selection and use of additive photosensitive chemicals need to take into account the characteristics and application requirements of the photosensitive material. Different types of photosensitive materials may require different additive combinations and formulations to obtain optimal image quality and performance.
