Abstracts

According to our (Global Info Research) latest study, the global AV-over-IP Distributed AV/KVM Management Platform market size was valued at US\$ 2418 million in 2025 and is forecast to a readjusted size of US\$ 3819 million by 2032 with a CAGR of 6.7% during review period.

An AV-over-IP Distributed AV/KVM Management Platform is a networked audiovisual and human-machine interaction management system used in control rooms, command centers, professional AV projects, multi-screen collaboration spaces, and mission-critical operations environments. The platform typically consists of AV encoders, decoders, KVM-over-IP endpoints, centralized management servers, control software, video wall management modules, user-rights management, and monitoring tools. It transports HDMI, DisplayPort, DVI, SDI, USB, keyboard-and-mouse, audio, serial, and control signals over Ethernet, fiber, or dedicated IP networks, enabling source acquisition, compressed or visually lossless transmission, matrix switching, live preview, video wall display, cross-screen mouse roaming, multi-operator collaboration, permission assignment, preset scenarios, and device health monitoring. This study focuses on hardware and software platforms centered on AV-over-IP, KVM-over-IP, distributed encoding/decoding, and video wall management for applications such as public safety command centers, traffic operations, utilities, enterprise NOCs/SOCs, broadcast facilities, meeting centers, education, and large campuses.

Based on our research, a distributed integrated management platform in the professional AV context should be understood as a control-room infrastructure layer rather than a generic management software category. Its core function is to manage audiovisual signals, KVM operator positions, video wall layouts, permissions, previews,

routing, and operational presets across an IP-based architecture. This makes the category fundamentally different from distributed energy management, cloud resource management, generic IT monitoring, video surveillance VMS, or standalone conferencing systems. The market boundary should therefore be defined around AV-over-IP, KVM-over-IP, distributed encoding and decoding, video wall management, and control-room visualization.

From a product and technology perspective, the industry will remain multi-route rather than converging immediately into one protocol or architecture. 1GbE compressed AV-over-IP, 10GbE visually lossless systems, fiber KVM, SDVoE, IPMX, and ST 2110-related architectures will coexist across different performance tiers. Lower-cost commercial AV projects prioritize ease of deployment and network compatibility, while mission-critical applications emphasize latency, redundancy, security, visual quality, and operational rights management. As a result, the competitive center of gravity is moving from hardware endpoints alone toward software control, system orchestration, interoperability, monitoring, and lifecycle management.
