Avalanche Transceiver (Avalanche Transceiver) is a device used to detect people buried by avalanches during snow sports such as skiing and mountaineering. Usually consists of two parts: a transmitter and a receiver. The transmitter and receiver communicate wirelessly via radio frequency signals. When an avalanche occurs, the prepared personnel will carry the receiver for search and rescue, and determine the position of the buried person by receiving the signal sent by the transmitter. In a popular method of use, if a searcher uses a transmitter to confirm the direction of a buried person, they press a button on the transmitter to switch to the best search direction, instructions to locate buried persons
