## Abstracts

Azimuth stern drive (ASD) tug is a tug where normal propellers and shafts have been replaced by azimuthing propulsion units, which enables the propeller and its associated nozzle to rotate about its vertical axis (360° rotation). The position of the propulsion units is identical to that of a conventional twin-screw tug. Just as with a twin-screw tug, these propulsion units can operate independently, making it possible for the tug to move forwards, backwards, sideways and turn around its own axis with great precision. The towing point on an ASD tug is located on the foredeck; however some ASD tugs may have additional towing points on their after decks, thus enabling them to function in a similar manner to a conventional twin-screw tug (but with increased manoeuvrability).

According to our (Global Info Research) latest study, the global Azimuth Stern Drive (ASD) Tug market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
