Abstracts

According to our (Global Info Research) latest study, the global Backplane Connectors market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Often referred to simply as a backplane, this special type of printed circuit board is used as a support structure for connecting other PCBs. The backplane connector adds mechanical strength and stability while also acting as a plane for integrating other system components called daughterboards. Daughterboards are connected to the backplane to perform different functions. The easy interchangeability of different cards is one of the reasons backplane connectors are so versatile and so widely used. Scalability, modularity and ease of use make backplane connectors a popular choice for people designing custom computer systems. Not to be confused with motherboards, backplanes do not have active components like microprocessors. The common misconception likely stems from backplane connectors being connected to single board computers or system host boards. At which point, the system does function like a motherboard.
