Abstracts

The global Bacterial Endotoxin Testing market size is expected to reach \$ 593 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

Bacterial Endotoxin Testing (BET) is a quality-control test used to detect and quantify bacterial endotoxins, mainly lipopolysaccharides from Gram-negative bacteria, in pharmaceutical products, biologics, injectable drugs, medical devices, dialysis products, raw materials, and process water. It is used to confirm that endotoxin levels remain within regulatory limits before product release, because endotoxins can trigger fever, inflammation, shock, or other serious patient safety risks. Common methods include gel-clot, turbidimetric, chromogenic LAL-based assays, and recombinant reagent methods such as recombinant Factor C.

The Bacterial Endotoxin Testing industry is moving toward faster, more automated, data-integrated, and animal-free testing solutions, driven by expanding biologics, vaccines, cell and gene therapies, injectable drugs, implantable devices, and pharmaceutical water monitoring. Key opportunities come from recombinant endotoxin testing reagents, outsourcing to contract testing labs, rapid microbiology platforms, and stricter GMP release testing requirements; the European Pharmacopoeia introduced recombinant Factor C as an alternative to classic LAL-based endotoxin testing, while FDA's 2026 guidance update broadened language to better accommodate recombinant reagents. Major challenges include method validation complexity, regulatory comparability requirements, matrix interference, high instrument/reagent costs, limited technical expertise, and the transition from horseshoe-crab-derived LAL reagents to recombinant alternatives while maintaining global pharmacopeial acceptance and customer confidence.
