According to our (Global Info Research) latest study, the global Bacterial Pesticides market size was valued at US\$ 2096 million in 2024 and is forecast to a readjusted size of USD 5499 million by 2031 with a CAGR of 14.9% during review period.

Bacterial pesticides are live preparations, and their principle of killing insects is that bacteria multiply after entering the insect body, producing toxic paraspore crystals, disrupting the normal physiological metabolism of pests, and causing them to die.

The market outlook for bacterial insecticides appears promising, with growing interest in sustainable and environmentally friendly pest control solutions. Bacterial pesticides, also known as biopesticides, use naturally occurring microorganisms to selectively target pests, providing a safe and effective alternative to traditional chemical pesticides. Growing awareness of the harmful effects of synthetic pesticides on ecosystems, human health, and non-target organisms is driving the demand for biobased pest control products. Moreover, stringent regulations surrounding conventional pesticides and the need for residue-free and organic farming practices are expected to boost the adoption of bacterial pesticides in agriculture. Despite the promising growth of the market, challenges such as the need for further research, education, and effective marketing strategies to build trust between farmers and consumers may affect the pace of adoption.
