Abstracts

The global Bactericide for Reverse Osmosis Membranes market size is expected to reach \$ 1409 million by 2032, rising at a market growth of 5.6% CAGR during the forecast period (2026-2032).

Reverse osmosis (RO) membrane-specific bactericides are water treatment chemicals used in RO membrane systems. They kill or inhibit bacteria, fungi, and biofilm formation, preventing membrane fouling and flux decline. They also exhibit low corrosivity to membrane materials and good compatibility, making them widely used in seawater desalination, industrial water treatment, and municipal water supply systems.

Upstream applications mainly include isothiazolinones, quaternary ammonium salts, bromine/chlorine-based feedstocks, and fine chemical intermediates. Downstream applications primarily include membrane protection and operation maintenance in seawater desalination, industrial circulating water, electronic ultrapure water, drinking water treatment, and energy and chemical water systems.

The global market price for RO membrane-specific bactericides is \$2035 per ton, with annual sales of approximately 460,000 tons and a global annual production capacity of approximately 700,000-900,000 tons. The industry profit margin is 25%.
